

Gosonic — Retell Agent Refinement & Training Notes

Foundational Principle

The voice agents are not a peripheral layer of Gosonic.

They are part of the product architecture itself.

Most systems treat the voice layer as:

- a wrapper
- a chatbot
- a utility interface

Gosonic should treat voice behavior as:

- operational infrastructure
 - brand expression
 - workflow instrumentation
-

Core Refinement Challenges

1. Consistency Under Real Callers

Callers interrupt, ramble, correct themselves, speak unclearly, or provide information out of order.

The agent must stay calm and recover without sounding robotic.

2. Latency and Pacing

Even a well-written agent feels poor if pauses, turn-taking, or response timing feel unnatural.

Retell flow design, model choice, endpoint speed, and prompt structure all matter.

3. State Discipline

The agent must:

- not re-ask captured information
- not restart intake
- not invent booking promises
- not loop after confirmation

This is where the Gosonic workflow canon becomes foundational.

4. Tone Calibration

The agent needs to sound:

- professional
- restrained
- calm
- operationally competent
- service-specific

HVAC, dental, legal intake, dispatch, concierge, and hospitality should not all sound the same.

5. Escalation Judgment

Urgency detection must be refined enough that the system:

- does not under-classify serious issues
 - does not over-escalate routine calls
-

6. Vertical-Specific Refinement

Each industry requires:

- its own vocabulary
- greeting rhythm
- confirmation structure
- escalation logic
- operational language
- silence handling
- recovery behavior
- closing cadence

Existing Gosonic Progress

Major foundational behaviors already stabilized:

- confirmation loop prevention
- deterministic end-call handling
- fallback sub-agent routing
- multi-field correction handling
- backend persistence
- webhook verification
- operational telemetry capture
- workflow-oriented architecture direction

These are foundational production behaviors.

Canonical Refinement Process

Each production voice agent should follow a disciplined refinement cycle:

```
Prompt design
→ controlled test calls
→ transcript review
→ failure classification
→ prompt/function adjustment
→ latency review
→ edge-case testing
→ production candidate
```

Long-Term Gosonic Direction

Agent refinement should eventually become one of Gosonic's core differentiators.

The platform should deliver:

- refined pacing
- controlled interaction rhythm
- operational clarity
- intelligent escalation behavior
- calm professional communication

- infrastructure-grade reliability

The goal is not novelty.

The goal is operational sophistication.
